

Copado Plugin

Plugin Information

View Copado [on the plugin site](#) for more information.

With this plugin you can add a build step to your Jenkins project that executes a [Copado Webhook API](#) task. You would add this step after your Copado setup is finished. After the Copado Webhook is triggered, the plugin will wait for the job run to finish (or timeout). If the Job step is successful, your pipeline will continue to the next step in your pipeline; however, if it fails (or times out), the build will be marked as failed.

Changelog:

v1.0

- First release.

v1.1

- Added support for payload parameter

v1.2

- Added support for build parameters on Webhook URL, API Key and Step Name
