

Artifact Diff Plugin

Plugin Information

View Artifact diff on the [plugin site](#) for more information.

Artifact diff plugin

Plugin can compare content of an artifact identified by its relative path among different builds.

URL format

Plugin introduces transient build action using `artifact-diff` url name. Action itself consumes build number to compare against followed by an artifact path.

```
<buildUrl>/artifact-diff/<otherBuildNumber>/<artifactPath>
```

The `output` argument is used to switch between the `html` (the default) and `plain` text output.

- `output = html|plain`

Output format

- Plugin uses the Unified diff format to represent artifact difference.
- `/dev/null` placeholder filename is used to represent an artifact that could not be read, such artifact is then treated as empty.
- An empty diff sequence is used when both artifacts equal.

Changelog

1.2

- Fix RunList related regression
