

Build Secret Plugin

Deprecated. Use [Credentials Binding Plugin](#) instead.

Lets you upload secret files to be used by a build.

Plugin Information

No information for the plugin 'secret' is available. It may have been removed from distribution.

You may have a keystore for jarsigner, a list of passwords, or other confidential files which you want to be used by a job but which should not be kept in its SCM, or even visible from its config.xml. Saving these files on the server and referring to them by absolute path requires you to have a server login, and does not work on slaves. This plugin gives you an easy way to package up all a job's secret files and access them using a single environment variable during the build.

Build Environment

Build Secret ?

Environment variable:

Secret ZIP:

Build

Execute shell ?

Command `ls -lR $SECRETFILES`

Do not use 1.0 or 1.1. 1.2 works but has no GUI for file upload; 1.3 fixes upload GUI.

1.4 adds JDK 5 compatibility (but only tested on JDK 6).

1.5 fixes file upload GUI for some servers (Tomcat and perhaps others).

1.6 permits users with only per-project Configure permission to upload the secret ZIP.

1.7 made the plugin work with folders.
