

# Text-finder Plugin

## Plugin Information

View [TextFinder](#) on the [plugin site](#) for more information.

This plugin lets you search keywords in the files you specified and use that to downgrade a "successful" build to be unstable or a failure. This is handy when you have some tools in your build chain that don't use the exit code properly.

The search is always performed, even on builds which returned a non-zero exit status, but the reclassification only applies to builds which returned an overall exit status of zero.

## Change Log

### Version 1.10 (Jan 31, 2014)

- No longer blocking concurrent builds. ([JENKINS-17507](#))
- Cleaner config UI using help buttons
- Japanese translation

### Version 1.9 (Feb 13, 2011)

- Update link in help

### Version 1.8 (Feb 6, 2010)

- Update code for more recent Hudson

### Version 1.7 (May 4, 2009)

- Fixed a file handle leak ([JENKINS-3613](#))

### Version 1.6 (Nov 6, 2008)

- Modified to work with all job types, including Maven2 jobs.

### Version 1.5

- Added "Unstable if found" configuration option. Use this option to set build unstable instead of failing the build. Default is off (previous behavior).
