

Xamarin Studio Tool Runner Plugin

Plugin Information

View Xamarin Studio Tool Runner [on the plugin site](#) for more information.

The plugin allows to use Xamarin Studio Tool Runner - mdtool. Presently only the Xamarin Studio Build Tool support implemented. This tool allows to build [Xamarin](#) projects.

Usage

You can specify multiple locations of `mdtool` on Jenkin's configuration page. Typically it located at Xamarin Studio application bundle: `/Applications/Xamarin Studio.app/Contents/MacOS/mdtool`. As you may guess, this location is valid for OS X.

On your project configuration page you can add "Build a Xamarin Studio solution using mdtool" build step and specify solution file (`.sln`) path. Also you can specify build target, solution configuration, name of the project to build, and prefix of the Mono runtime to build against.
