

# Test Management for Jira

## Plugin Information

View Test Management for Jira [on the plugin site](#) for more information.

A plugin for Jenkins built for integrating automated tests with [Test Management for Jira Server \(TM4J\)](#).

The plugin introduces two new configuration steps for Jenkins jobs:

1. A build step to export Gherkin feature files (BDD) from TM4J
2. A post-build step to import the test results back to TM4J

These two configuration steps depends on a global configuration (Manage Jenkins > Configure System) where the user can add/configure different Jira instances to be used on each build step.
