

# Bitbucket Approval Filter Plugin

## Plugin Information

View Bitbucket Approval Filter [on the plugin site](#) for more information.

This plugin works along with the [Bitbucket Branch Source Plugin](#) and allows filtering out pull requests based on their approval status.

Note: There is a known issue with using the Basic Branch Build Strategies Plugin with named branches not building when using this plugin.

The different approval statuses supported are:

- No Approval Necessary
  - This is the same behavior as not having the plugin installed. Approvals have no affect on whether a pull request will be built or not.
- Any Approval Required
  - Before being built a pull request must have an approval, this approval could come from the author of the Pull Request.
- Non-Author Approval Required
  - Before being built a pull request must have an approval that is from a user that is not the author.
