

Permissive Script Security Plugin

Turn on permissive mode of Script Security Plugin. Problematic signatures will be logged but access will not be rejected.

Plugin Information

View Permissive Script Security [on the plugin site](#) for more information.

This plugin enables execution of unsecured groovy scripts on Jenkins master. Do not use it unless you know what you are doing.

Suppressing the security put in place in several Jenkins plugins is discouraged though sometimes useful practice. For example, migrating configuration from a plugin version that allows unsecured script execution to the secured version. Enabling this temporarily, will not block on potentially unsafe signatures so they can be evaluated and whitelisted and the plugin can be uninstalled again.

The plugin is disabled after installation. It can be enabled providing `-Dpermissive-script-security.enabled=true` property to Jenkins master JVM. Since 0.3, value `no_security` is supported to permit not whitelisted signatures without any logging. Note that this is not secure at all.
