

CocoaPods Plugin

Plugin Information

View CocoaPods Jenkins Integration [on the plugin site](#) for more information.

This plugin provides a very basic build step for projects which use CocoaPods.

This adds a "Update CocoaPods" build step, which runs `pod repo update` and then `pod install` in the root of your workspace. Optionally, by checking the Clean "Pods" folder option, the Pods folder will first be deleted.

Note: there currently isn't any advantage to installing this plugin, compared to using an "Execute shell" step to run these commands yourself.
