

elboca

Plugin Information

No information for the plugin 'elboca' is available. It may have been removed from distribution.

Description

This plugin allows jenkins servers to send/publish xmpp PubSub events to an xmpp server as a build step. You can specify the actual payload in the job configuration.

Note:

The payload should be in a valid XML-structure (like other xmpp-events).
The validation of the specified xml-payload is validated on-the-fly.
So please make sure the entered payload is accepted before starting builds.

Note:

You can create inter-jenkins communication when combining this plugin with the elOyente plugin.
This last plugin, actually triggers builds based upon sent xmpp PubSub events.
