

# About this Confluence

This page describes user-defined macros and short-cut notations defined in this Wiki.

## User macros

### comment

You can use the `{comment}...{comment}` macro to surround Wiki markups that you don't want to render. This macro still allows you to keep such text in Wiki.

### advanced-plugin-topic

The `{advanced-plugin-topic}` macro will render the boiler-plate header for advanced topics for plugin developers, as shown below:

If you are just getting started with writing a Jenkins plugin, then this is not something you need to worry about right now. Come back to this page when you got something working.

### jenkins-plugin-info

The `{jenkins-plugin-info:pluginId=XXXX}` macro will render basic information about a plugin like:

- the latest release version and date
- the maintainers
- the link to the latest changes in SCM (either SVN or git) and issue tracker

## Shortcut Links

### Issue

`[1234@issue]` points to issue #1234 in the [issue tracker](#).

### Javadoc

`[Jenkins@javadoc]` points to the javadoc of `jenkins.model.Jenkins`. As long as the short class name is unique, that's sufficient, but you can also use a fully-qualified class name, like `[jenkins.model.Jenkins@javadoc]`

## Suggestions?

For additional suggestions, please send e-mails to the dev list.
