Google Metadata Plugin

This plugin provides a basic framework for steps in a build's lifecycle to attach JSON-serializable metadata to a build (as an invisible action).

This metadata can be produced and attached by any build step (stay tuned for examples).

This metadata can then be attached to build artifacts (see our [Google Cloud Storage plugin](#) for an example of this).

Version 0.1 (March 18, 2014)

- Initial release
