

Block Build Final Project Plugin

Plugin Information

View Block Build Final Project [on the plugin site](#) for more information.

Block build when upstream/downstream project is building. Optional final projects may be given.

Summary

This plug-in allows a project to block when upstream or downstream projects are building. Jenkins already provides this functionality built-in, but it blocks on the entire pipeline. This plug-in allows an optional final project to be specified. This allows the project to block on part of the pipeline instead of the entire pipeline.

When configuring a project, the following options are available when this plugin is installed:

<input checked="" type="checkbox"/> Block build when upstream project is building - final project		
Final upstream projects - optional	<input type="text" value="upstream-project"/>	
<input checked="" type="checkbox"/> Block build when downstream project is building - final project		
Final downstream projects - optional	<input type="text" value="downstream-2a,downstream-2bAlpha"/>	

Example

For a detailed example on how to use this plugin, please visit [GitHub README.md](#).

Requirements

Jenkins

Jenkins [version 1.625.3](#) or newer is required.
