

Zapper Plugin

Zapper is a Jenkins Continuous Integration system plugin that helps you run OWASP ZAP as part of your automated security assessment regime. The plugin can use a pre-installed version of ZAP when given the path to the ZAP installation. Alternatively, it can automatically download and build a version of ZAP to be used by your security tests.

Plugin Information

View OWASP ZAP [on the plugin site](#) for more information.

Release Notes

Version 1.0.7

- Adds support for configurable ZAP source checkout directory during automated ZAP build.
- Zapper now maintains a clone of the latest (at the time of Zapper release) OWASP ZAP trunk on GitHub. This clone is tested and guaranteed to build successfully. This is necessary because the current trunk may not actually build. Of course the ZAP repository to use by Zapper is settable, and can be set to the official trunk or any branch or release from the official OWASP ZAP repository.

Version 1.0.0

Initial release.
