

Unicorn Validation Plugin

Plugin Information

View Unicorn Validation [on the plugin site](#) for more information.

This plugin uses W3C's Unified Validator, which helps improve the quality of Web pages by performing a variety of checks.

General

The plugin uses gets number of errors/warnings from W3C's Unified Validator. W3C Unicorn Service (<http://validator.w3.org/unicorn/>) helps to improve the quality of Web pages by performing a variety of checks (HTML validation, CSS validation,...). This plugins takes few arguments (url to check, w3c validator url and threshold for number of errors and warnings to decide the build result) ... look at the Configuration section.

It outputs results to the console and to some properties files which can then be later used with Plot Plugin to output some build history graphs (see the template below for configuration).

Example of results

```
Console Output

Started by user jernejz

-----
Unicorn validation results for http://nej.si
-----

W3C HTML Validator (markup-validator)
Number of errors   : 92
Number of warnings : 0

W3C CSS Validator (Level 3) (css3-validator)
Number of errors   : 0
Number of warnings : 8

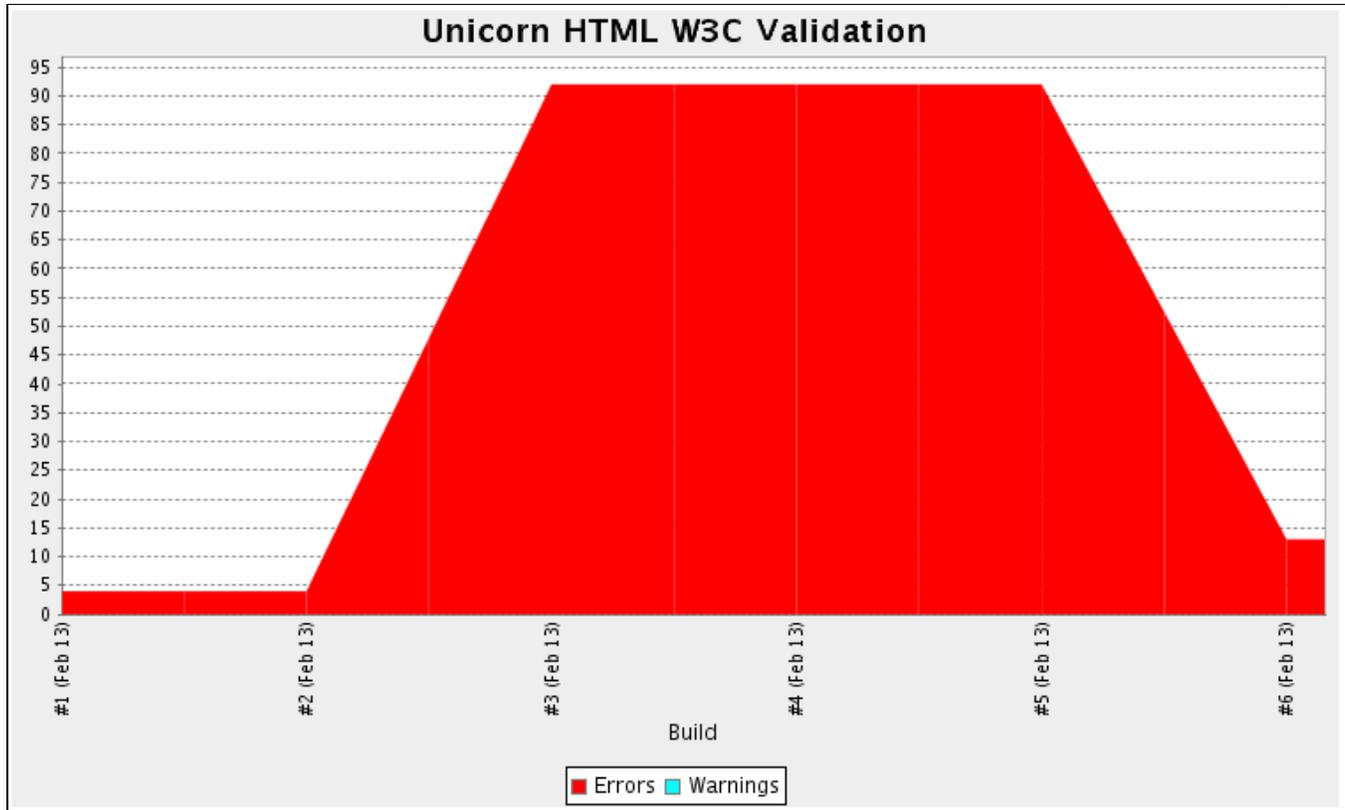

Feed Validator (feed)
Number of errors   : 0
Number of warnings : 7

Saving plot series data from: /var/lib/jenkins/jobs/Unicorn nej.si/workspace/markup-validator_errors.properties
Saving plot series data from: /var/lib/jenkins/jobs/Unicorn nej.si/workspace/markup-validator_warnings.properties
No plot data file found: css21-validator_errors.properties
No plot data file found: css21-validator_errors.properties
Saving plot series data from: /var/lib/jenkins/jobs/Unicorn nej.si/workspace/feed_errors.properties
Saving plot series data from: /var/lib/jenkins/jobs/Unicorn nej.si/workspace/feed_warnings.properties
Finished: FAILURE
```

Example of the W3C Unicorn html output

The screenshot shows the W3C Unicorn validation interface. At the top, it says "W3C Unicorn - W3C's Unified Validator" with the tagline "Improve the quality of the Web". Below this, there is a section for HP support, stating "The W3C validators are hosted on server technology donated by HP, and supported by community donations." and a "Donate" button. A "Flattr" button with a count of 1079 is also visible. The main content area shows three test results: "This document has not passed the test: W3C HTML Validator" (red bar, 92 errors), "This document has passed the test: W3C CSS Validator (Level 3)" (green bar, 1 info, 8 warnings), and "This document has passed the test: Feed Validator" (green bar, 3 info, 7 warnings). At the bottom, there are links for "Documentation", "Download", "Feedback", and "Translations". The footer includes the Open Source logo and copyright information: "COPYRIGHT © 1994-2011 W3C® (MIT, ERCIM, KEIO), ALL RIGHTS RESERVED. W3C LIABILITY, TRADEMARK, DOCUMENT USE AND SOFTWARE LICENSING RULES APPLY. YOUR INTERACTIONS WITH THIS SITE ARE IN ACCORDANCE WITH OUR PUBLIC AND MEMBER PRIVACY STATEMENTS."

Configuration

Global Configuration

None.

Project Configuration

For a project to use the Unicorn Validation plugin, you need to add it as a build step to your job:

Build	
Unicorn Validator	
Unicorn service URL	<input type="text" value="http://validator.w3.org/unicorn/"/>
Site to validate	<input type="text" value="http://www.example.com"/>
Max number of errors for build to still be stable	<input type="text" value="0"/>
Max number of warnings for build to still be stable	<input type="text" value="10"/>
Max number of errors for build to still be unstable	<input type="text" value="10"/>
Max number of warnings for build to still be unstable	<input type="text" value="25"/>
<input type="button" value="Delete"/>	

Here you can specify:

Unicorn service URL - the w3c's url is the default one, but you can specify your own if you have custom unicorn service

Site to validate - the url of the site to validate

Max number of errors/warnings for build to be stable/unstable - this is your threshold to decide if the build should be stable/unstable/failed ... currently these number are the same for every aspect of unicorn result (html, css, rss).

Plot Configuration

You can also get a pretty graph which shows you number of warnings/errors of previous builds. There a unicorn template for that to help you configure it.

Plugins required:

- [Plot plugin](#)

Steps to create a new job:

1. Check out the [unicorn-template project](#) from Git: `git@github.com:nej/unicorn-template.git`
2. Reload Jenkins' configuration
3. Click on "New Job".
4. Enter a "Job name".
5. Select "Copy existing job" and enter "unicorn-template" into the "Copy from" field.
6. Click "OK".
7. Disable the "Disable Build" option.
8. Setup your build trigger
9. Fill in your "Site to validate" url
10. Click "Save".

TODO

- currently these number are the same for every aspect of unicorn result (html, css, rss) ... ability so specify numbers for each result specifically
- currently all the test are executed that the unicorn validator offers ... ability to choose which ones to execute

Version History

0.1.0 (Feb 13, 2011)

- Initial public release
