

Bitbucket pullrequest builder plugin

Most critical issues found with Bitbucket pullrequest builder plugin is no control in triggering builds by open pull requests. When the plugin is initially installed & configured, all open pull requests will be triggered, which might crash the system when there are many open PRs. Besides, whenever a user creates a PR or commits a change, the build will be triggered, causing massive unnecessary build processes and failures. Users like to control the triggering of builds when it's ready.

Suggestion: add a checkbox like below

Only build if asked with the build phrase	<input type="checkbox"/>
---	--------------------------

Plugin Information

View Bitbucket Pullrequest Builder [on the plugin site](#) for more information.

This plugin builds pull requests from Bitbucket.org and will report the test results. Basic documentation can be found on [GitHub](#).
