

Tracking SVN Plugin

Plugin Information

View Tracking SVN [on the plugin site](#) for more information.

Lets one project track the Subversion revisions that are checked out for another project.

More than one module may be used, and the revision tracking will happen for any URL in this project that exactly matches the tracked project. For all other modules, the latest revision will be used.

When building, the TRACKING_SVN_BUILD environment variable will contain the URL of the tracked build.

It is generally useless to use SCM polling if SVN tracking is enabled. Instead, trigger this project from the tracked project.

Change Log

Version 1.1 (Jan 3, 2011)

- Fixed env var
- Link to tracked project on main page
- Add option to ignore certain URLs from tracking

Version 1.0 (Nov 28, 2009)

- Initial release
