

BlameSubversion

This plug-in provides utilities for getting svn info from upstream job to downstream job

Plugin Information
View Blame Subversion on the plugin site for more information.

The original purpose of creating BlameSubversion is to solve [JENKINS-7509](#).

Why need BlameSubversion plugin?

*When some body check the code in , the Upstream job1 or upsteam job2 will build the source code.

*When the upstream job1 or upsteam job2 is done, it will invoke the build of downstream job2

*When the downstream job2 build failed, the svn info about who check in upstream job1 or upstream job2 was lost

How did BlameSubversion plugin work?

*1 get the build of upstream job who trigger this build of downstream

*2 get svn info from it

*3 copy svn info to downstream build

*4 provide interfaces for other official hudson plugins.

How did BlameSubversion plugin work?

Easy configure of BlameSubversion plugin

1 choose the checkbox of Blame Subversion in Souce code Management

2 choose the checkbox of Always Collect SVN info from upstream job if you are sure to do it.
