

URL SCM

Plugin Information

View URL SCM [on the plugin site](#) for more information.

This plugin allows the use of URLs as an SCM.

This is an SCM plugin for Jenkins. While URLs are not actually a proper SCM, the two main behaviors of an SCM are supported - checkout and polling. Polling is accomplished by checking the last-modified property of the URL. Checkout is accomplished by copying the content of the URL into the workspace as a file. The file is given the same name as the final filename component of the URL. URLs without a filename component cannot be used at this time.

This does duplicate some of what the [URLChange Trigger plugin](#) does.

Benefits this plugin over the URLChange Trigger are:

1. You can choose your own polling schedule via the SCM Polling trigger.
2. Less resource intensive polling mechanism, since checking last-modified requires few bytes to transfer, regardless of the amount of data in the URL.

Benefits of URLChange Trigger over this plugin:

1. Jenkins only supports one SCM plugin per project. If you want to trigger an SCM checkout via a URL, then URLChange Trigger is a better choice.
2. The last-modified property of a URL is not the right trigger for your builds, instead you need the content of the URL to change to trigger a build.

Change Log

Version 1.6 (Nov 2, 2011)

- JENKINS-11572

Version 1.5 (Jan 27, 2010)

- Update code for more recent Hudson

Version 1.4 (Jun 24, 2008)
