

Commit Skip SCM Behaviour Plugins

Plugin Information

View GitHub Commit Skip SCM Behaviour [on the plugin site](#) for more information.

Plugin Information

View Bitbucket Commit Skip SCM Behaviour [on the plugin site](#) for more information.

Summary

Description

A set of plugins, extending the filtering abilities of SCM plugins.

These filters will ignore events that the source branch last commit contains the tags [skip ci] or [ci skip]. It provides a similar functionality as [Circle CI does](#).

The filtering is only performed at change requests events, so push events to non-pull requests will be always run.

Current functionality is implemented at:

- [Bitbucket Commit Skip SCM Behaviour Plugin](#)
- [GitHub Commit Skip SCM Behaviour Plugin](#)

Warning!

The current implementation works over "tagging" the relevant pull request job as excluded. This way, the job will be disabled (won't be executable via the UI) and might get erased if an Orphaned Child policy kicks in, losing the whole PR run history.

Usage

When defining a new Github Organization or Bitbucket Team/Project job, include an additional behaviour (placed under the "Additional" separator).

Commit message filtering strategy

This behaviour is not configurable. It will just show a simple inline help icon:

Behaviours

..... Within repository

Filter by name (with wildcards)

Include ?

Exclude ?

..... Additional

Commit message filtering strategy ?

Dependencies

Each filtering trait requires its related SCM plugin:

- github-scm-trait-commit-skip github-branch-source-plugin
- bitbucket-scm-trait-commit-skip bitbucket-branch-source-plugin
