

Configuring Jenkins upon start up

Initialization Script

Jenkins can execute initialization scripts written in Groovy if they are present during start up. See [Groovy Hook Script](#) for details. The hook name for this event is "init".

Those executions happen at the very end of the initialization, and therefore this can be used to pre-configure Jenkins for a particular OEM situation.

While one can always write a plugin to [participate in the initialization of Jenkins](#), this script-based approach can be useful as it doesn't require any compilation and packaging.
